

9800 Thermal Dynamics

Making the best even better. The standard Low E/Argon-filled glass package can be upgraded to provide even more energy efficiency.

The Terrained Super Spacer® is made of solid silicone foam and reduces conduction rates to all-time lows.

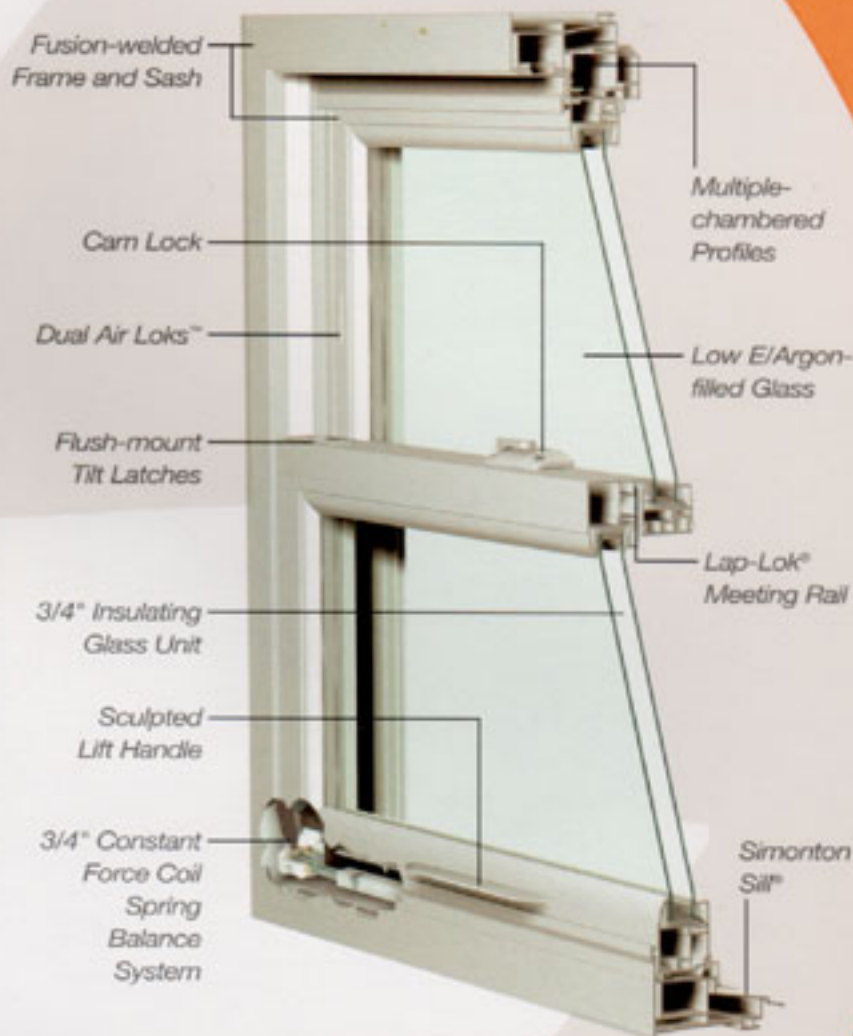

Sensor Glass™ An optional glass package that combines Low E/Argon-filled glass, a 1" double-strength I.G. unit and the Terrained Super Spacer® — a solid silicone foam spacer which is more thermally efficient than other types of spacer systems.

Super Sensor Glass™ Increases the benefits of Sensor Glass™ with Low E coatings on two surfaces and a triple-paned I.G. unit featuring double-strength glass. In addition, heavier Krypton gas replaces Argon gas inside the insulating glass unit.

Super Sensor Plus™ Everything inside the Super Sensor Glass™ package plus a clear, laminated layer sandwiched between two panes of glass. The laminated layer helps keep unwanted noise from things like traffic and lawnmowers outside your home. And for added safety, Super Sensor Plus™ is the preferred choice. While the glass will still shatter when struck with force, the glass panes remain adhered to the laminated layer and will not fall out inside the home. The laminated layer is very difficult to penetrate, making this optional glass package a great choice for use around doors and in windows in your basement and on the first floor of your home.
